Redis

SCAN

Syntax

```
SCAN cursor [MATCH pattern] [COUNT count] [TYPE type]
```

Available since: 2.8.0

Time complexity: $O(1)$ for every call. $O(N)$ for a complete iteration, including enough command calls for the cursor to return back to 0. N is the number of elements inside the collection.

ACL categories: @keyspace, @read, @slow

The **SCAN** command and the closely related commands **SSCAN**, **HSCAN** and **ZSCAN** are used in order to incrementally iterate over a collection of elements.

- **SCAN** iterates the set of keys in the currently selected Redis database.
- **SSCAN** iterates elements of Sets types.
- **HSCAN** iterates fields of Hash types and their associated values.
- **ZSCAN** iterates elements of Sorted Set types and their associated scores.
